

Tackle condensation in your home

Wipe it, open it, move it!

Condensation is the number one cause of household problems with damp and mould, but you have the power to stop condensation in its tracks.

Condensation, or little water droplets on a surface, happens when warm, moist air meets a cold surface (like a cold glass of pop on a warm day) or when cold air meets a warm, moist surface (like windows on a cold morning).

Those little water droplets can cause bigger problems if left to settle like black mould growing on walls, tiles, or furniture.

What can be done?

Don't let condensation settle: wipe it, open it, move it.

Wipe it: wipe away any water or moisture you see on surfaces such as windows, walls or furniture.

Open it: open a window when cooking or when taking a hot bath or shower to let the warm, moist air out. Keep air vents open on your windows and always use an extractor fan.

Move it: move furniture and curtains away from walls and make sure air can circulate in your home so the moist air can escape.

Try to keep a constant low heat in your home, to help avoid rapid temperature changes. Along with ventilation, this will help avoid moist air evaporating and turning into condensation.

Why is it important?

By following these simple steps, you can have a healthier, cleaner home for you and your family and avoid having to pay for future repairs work
